

Mini DTOF Principle Lidar

LD19

LD19 is mainly composed of laser ranging core, wireless transmission unit, wireless communication unit, angle measuring unit, motor driving unit and mechanical housing.

The LD19 ranging core adopts DTOF technology to measure 4500 times each second. When it works, LD19 emits the infrared laser forward, the laser is reflected to the single photon receiving unit after encountering the target object. Thus, we get both time of laser emitting and receiving, the gap between them is time of flight. With the light speed, we can calculate the distance.

After receiving distance data, LD19 will combine them with angel value getting from angle measurement unit to comprise the points cloud data, then transmitting the points cloud data to external interface via wireless communication. Meanwhile the external interface provides PWM to allow motor driving unit to drive the motor. After the external control unit gets the rotational speed , it will reach to specified speed through PID algorithm closed-loop control to ensure LD19 work stably.

Features

- 12m measuring radius
- 30000lux resistance to strong light
- 4500HZ measurement frequency
- 360° scanning range
- Laser safety FDA Class I
- TOF flight time ranging
- Compact appearance
- 10000h service life

Application Field

- Education
- Scientific research
- Algorithm
- Robot obstacle avoidance
- Autonomous navigation
- Navigation and positioning

1. Specifications

1.1. Electrical and Mechanical Parameters

Parameters	Unit	Minimum	Typical	Maximum	Remarks
Input Voltage	V	4.5V	5V	5.5V	
PWM Frequency	KHz	20	30	50	Square wave signal
PWM High Level	V	3.0	3.3	5.0	
PWM Low Level	V	-0.3	0	0.5	
PWM Duty Cycle	%	0	40	100	Scan rate around 10HZ when PWM duty at 40%
Start up Current	mA	-	300	-	
Work Current	mA	-	180	-	
Size	mm	38.59*38.59*33.50 (L*W*H)			
Weight	g	-	47	-	Without cable
Interface	-	UART @ 230400			
UART High Level	V	2.9	3.3	3.5	
UART Low Level	V	-0.3	0	0.4	
Drive Motor	-	BLDC			Brush-less motor
Operating Temperature	°C	-10	25	40	
Storage Temperature	°C	-30	25	70	

1.2. Optical Parameters

Parameters	Unit	Minimum	Typical	Maximum	Remarks
Laser Wave Length	nm	895	905	915	Infrared band
Laser Power	mW	-	25	-	Peak power, the actual average power is much lower than this value
Laser Safety Standard	-	IEC -60825 Class 1			
Pitching Angle	°	0	0.5	2	

1.3. Performance Parameter

Parameters	Unit	Minimum	Typical	Maximum	Remarks
Range	m	0.02	-	12	70% target reflectivity
Scan Frequency	Hz	5	10	13	External PWM speed control
Sampling Frequency	Hz	-	4500	-	Fixed -Frequency
Ranging Accuracy	mm	-	-	-	When distance <=300mm, no accuracy requirements. The trend of ranging data is consistent with the trend of actual distance
	mm	-45	-	+45	When distance >300mm and <=12000mm, average value of 100 measurements(70% diffuse reflection surface)
Ranging standard deviation	mm	-	10	-	When distance >300mm and <=12000mm
Measurement resolution	mm	-	15	-	
Angular Error	°	-	-	2	
Angular Resolution	°	-	1	-	
Anti-ambient Light	KLux	-	-	30	
Life Time	h	10000	-	-	

2. Data Interface

2.1. Communication and Interface

LD19 uses ZH1.5T-4P 1.5mm standard socket to connect with external system for power supply, rotation control and data output. The specific interface definition and parameter requirements are as following:

No	Signal	Type	Description	Minimum	Typical	Maximum
1	Tx	Output	Lidar data output	0V	3.3V	3.5V
2	PWM	Input	Motor control signal	0V	-	3.3V
3	GND	Power	Power negative	-	0V	-
4	P5V	Power	Power positive	4.5V	5V	5.5V

LD19 has a continuously variable motor driver inside, which supports internal speed control and external speed control. When the PWM pin is not connected or connecting to Hi-Z, the Lidar will use internal speed control, and the default speed is 10Hz. When the PWM pin connecting to a square wave signal, the Lidar will use external speed control, and the start, stop and speed of the motor can be controlled by the duty cycle of the PWM signal. Because of the individual differences of each motor driver, the actual speed may be different when the duty cycle is set as a typical value. If need to accurately control the motor speed, you should do closed-loop control via the rotation speed information from the receiving data.

The data communication of LD19 uses standard asynchronous serial port(UART) in one way , and the transmission parameters are shown as below table:

Baud Rate	Data Bits	Stop Bits	Parity Bit	Flow Control
230400	8 Bits	1	No	No

LD19 adopts one-way communication. After working stably, it begins to send measuring data without any instruction.

2.2. Coordinate System Definition

LD19 uses the left handed coordinate system , the front side of the sensor is defined as the x-axis (namely the zero direction), the rotation center is the coordinate origin, and the rotation angle increases along the clockwise direction. Please refer to below photo:

3. Optical Windows and Mechanical Dimensions

The laser emitting and receiving of LD19 measuring unit will need an optical window which should be structurally exposed. Any external shield to the window will impact LD19 measuring performance in some degree.

The following figures show the size of the optical window (Unit: mm) .

The shaded part in above photo is the optical window. Please do not cover it.

Please refer to below figures for other installation dimensions (Unit: mm) :

Tolerance : $\pm 0.2\text{mm}$

4. Safety and Application Scope

LD19 uses a lower powered infrared laser as emission light source to ensure the safety of human and pets. This Lidar has passed testing and conformed to Class I, 21 CFR 1040.10 and 1040.11 safety level, except for

the deviation of Laser Notice No. 50 of June 24, 2007.

Caution: The personal adjustment or reassembly of the Lidar may result in hazardous radiation exposure.

5. Customized Requirements

Its software, hardware parameters and structure can be customized according to customer's demand. If you have any requirement, please contact LDROBOT.
